

Swing Carriage

Swing Carriage - The load capacity of a forklift jib has a maximum of roughly 1935 lbs to 6000 lbs on either the retracted or extended positions range. You may need to discuss with a material handling specialist regarding the particular limits of your lift truck application. The load capacity rankings are for the jib itself and not the forklift or the maximum load which could be moved safely making use of a particular forklift. It is essential to bear in mind that at any time when any accessories such as a forklift jib are connected to the lift truck, the new center of gravity created by the attachment will lessen the general lift capability of the forklift. There are directions available which offer information on the way to accurately gauge these load limits.

Before using whatever forklift jib, make sure that the hooks and shackles are properly secured to the forklift. Verify and even double check that the pins are tight. It is necessary that the weight calculations are correctly done and double checked. Remember to consider the fact that rated capacities occasionally lessen whenever the boom is in an elevated position, when the boom is extended with telehandlers or even when the mast is tilted forward.

A few vital tips about the modifiable jib are: never pull a load using a lift truck jib attachment, in view of the fact that these attachments are really designed for vertical lift only. All the time pick up the load without letting it sway. Utilize extreme caution each and every time a load is lifted to prevent tipping over the truck.
